SHIFT-LEFT TESTING

AT A EUROPEAN INVESTMENT BANK

A SOFTWARE ENGINEERING CASE STUDY

THE CLIENT AND ITS SOFTWARE

A European online trading bank

THREE CRITICAL SYSTEMS

- Trading application
- Customer website
- Partner API

Failures can impact **financial transactions** and **partners**.

THE TESTING PROBLEM

Mostly manual
regression testing

Over 2,000 testing hours
each release cycle

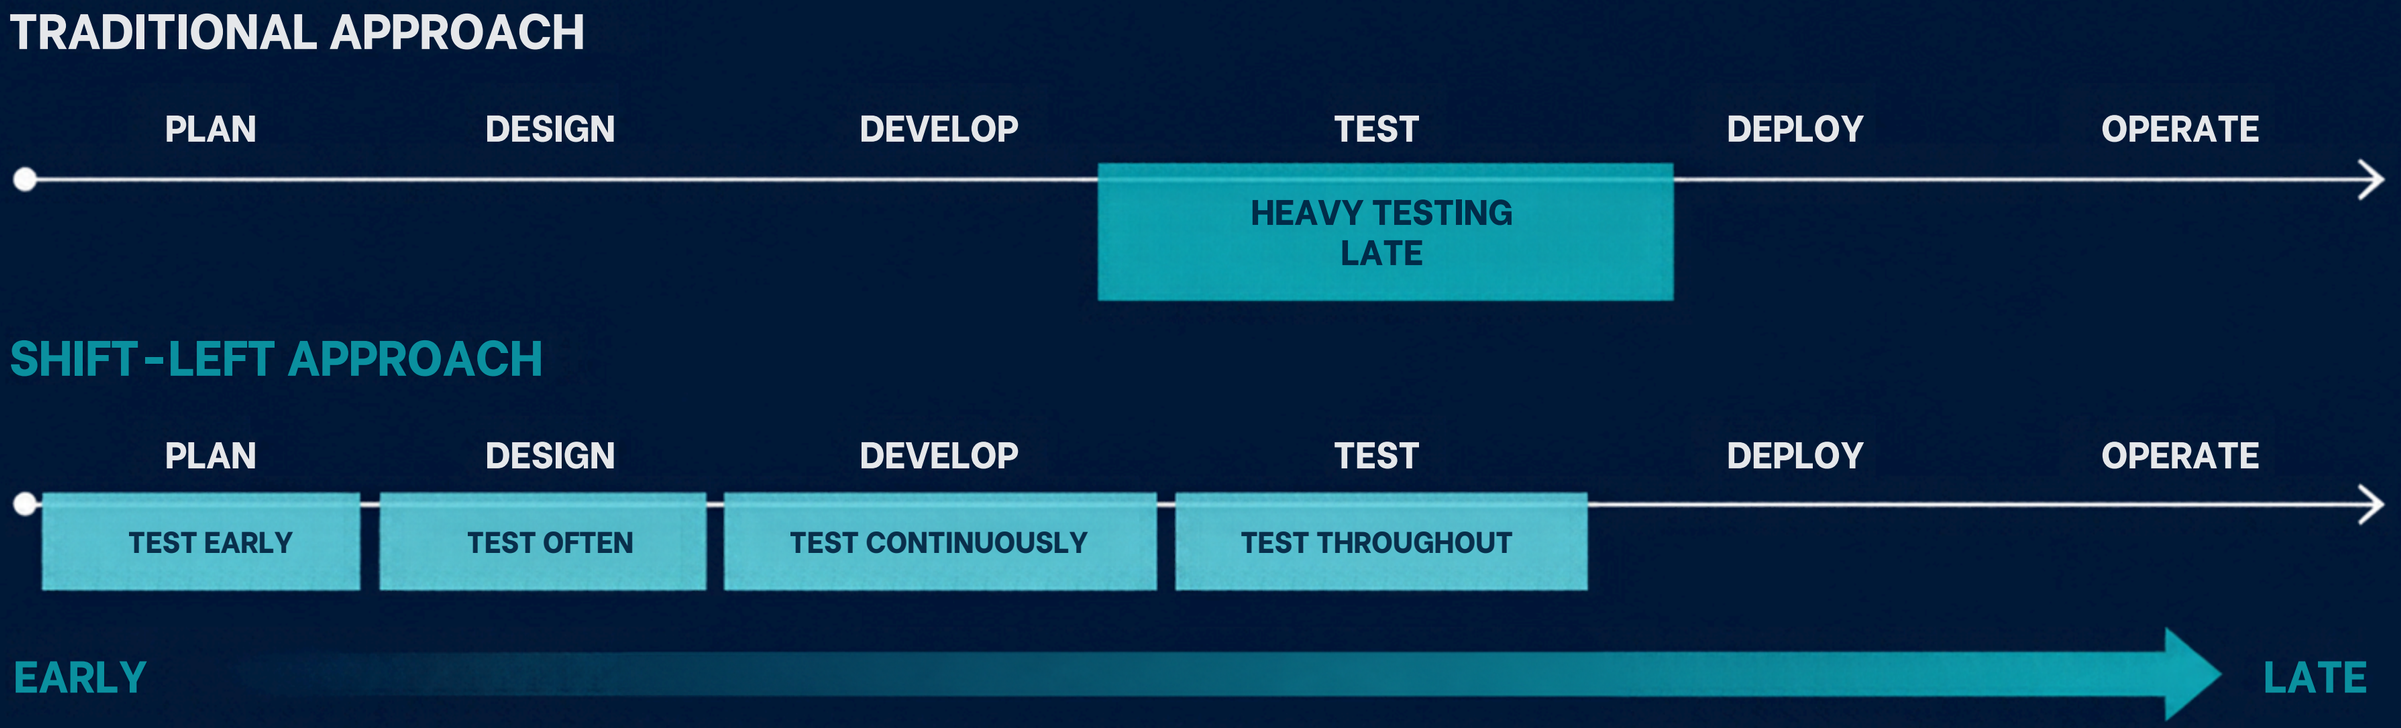

Gaps across
three platforms

Slow releases and
critical production defects

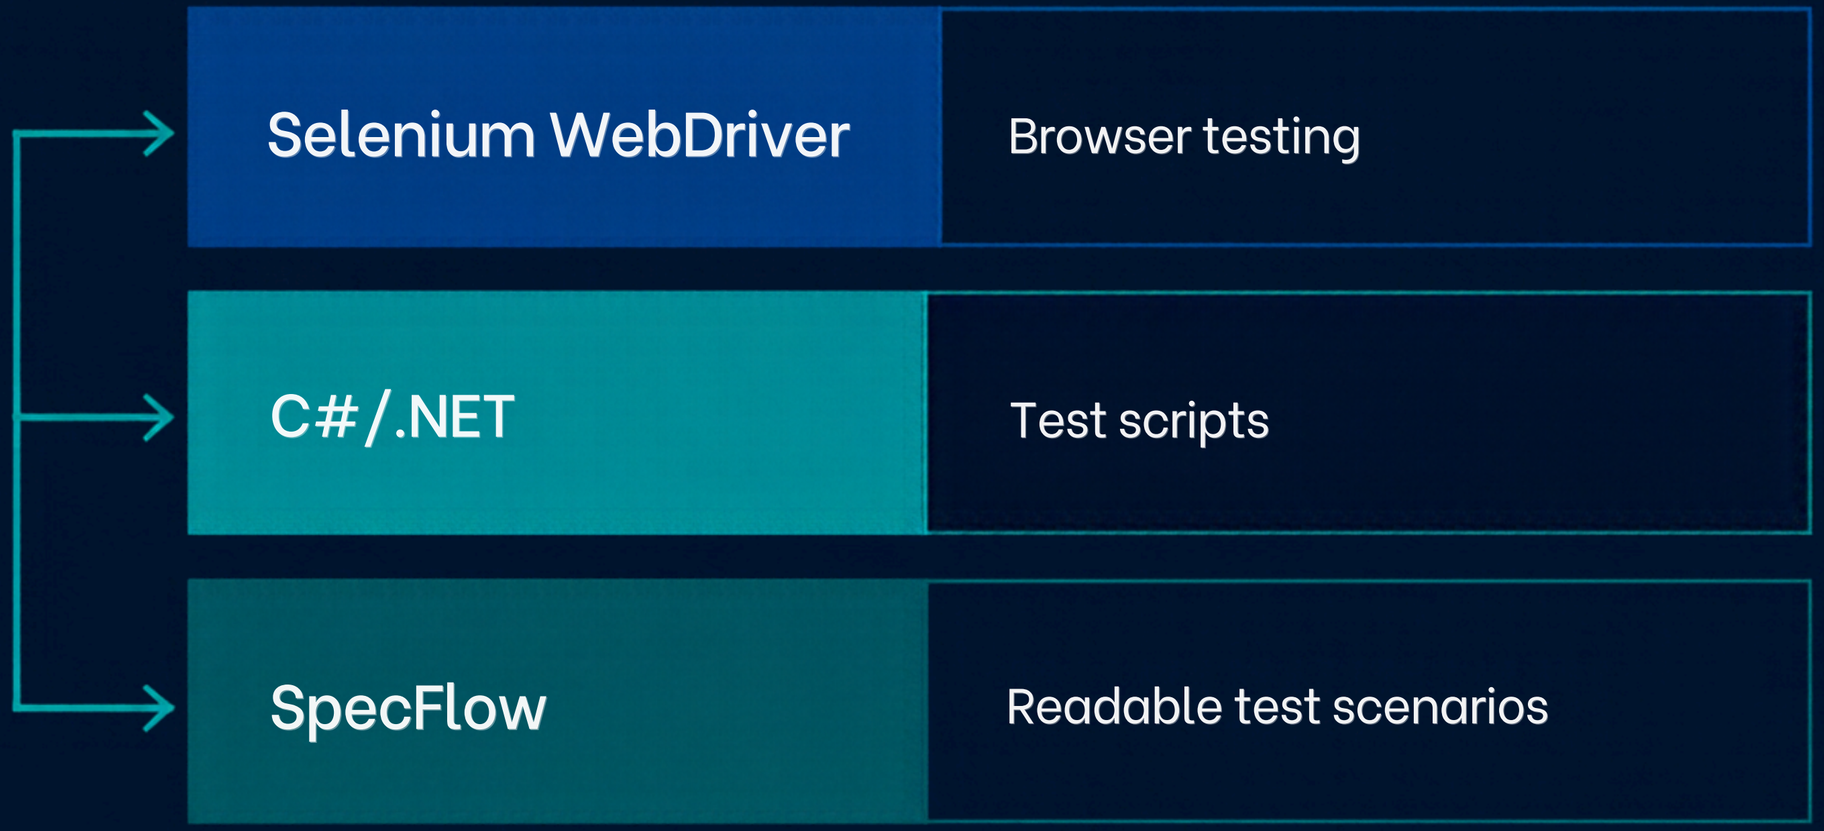

SHIFT-LEFT TESTING

Move testing earlier in the lifecycle.
Test **continuously**, not just at the end.
Earlier feedback makes bugs **easier to fix**.

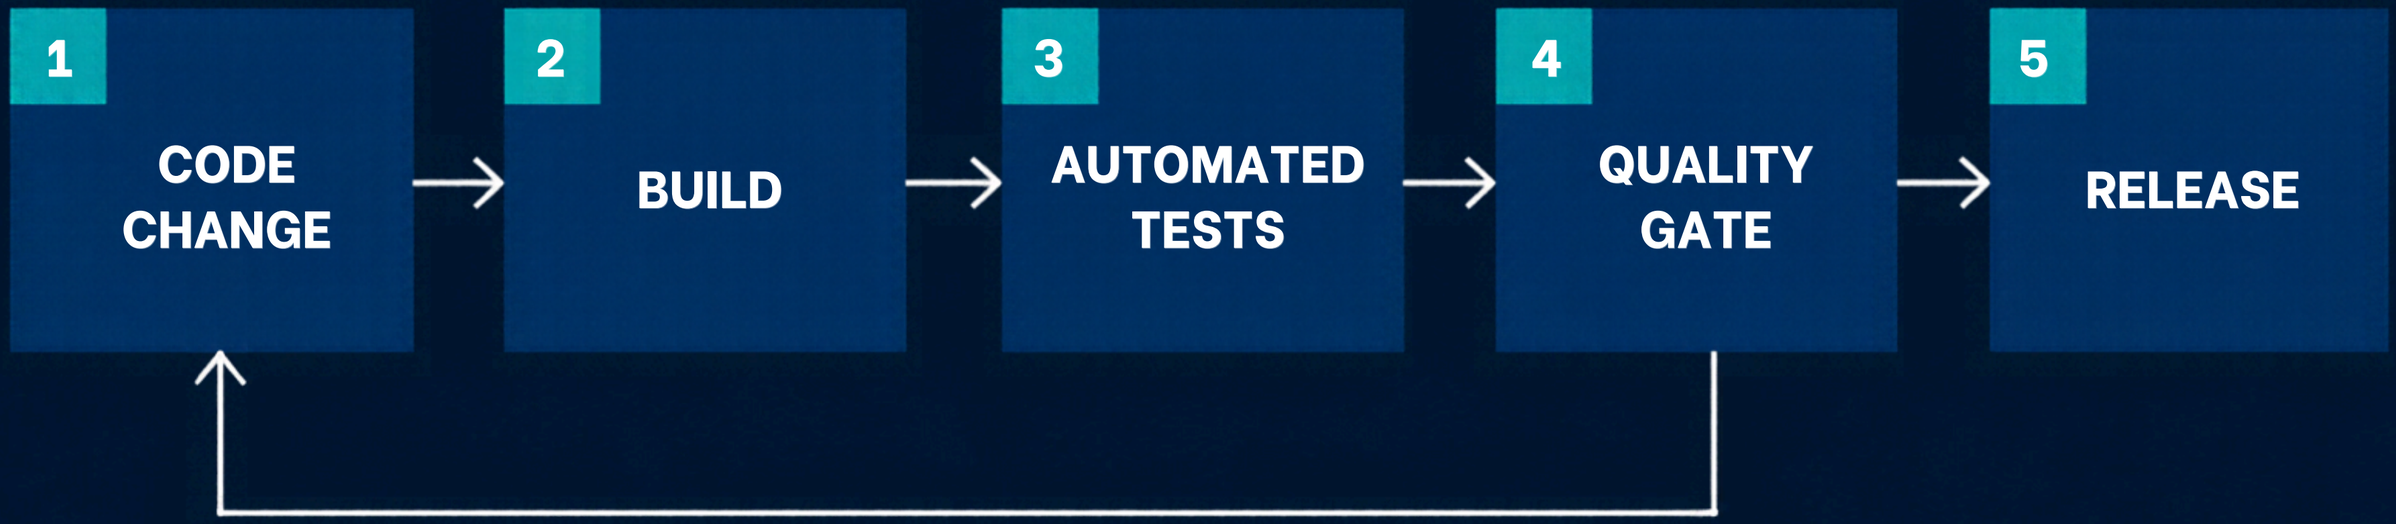

AUTOMATION TOOLS

Automated trading flows, customer journeys and API integrations

TESTING IN CI/CD

A failed test sends the change back
for correction

RESULTS

75–80%

less regression testing time

$700,000+

annual savings

Before: 2,000+ manual testing hours per release

A reduction from 2,000 to about 400 hours would represent 80%; 400 is illustrative

RESULTS AND KEY LESSONS

~40%	to >90% test coverage
monthly	to biweekly releases
zero	critical production defects in the next 12 months

Automate high-risk tests

Integrate testing into CI/CD

Maintain test scripts
